Domains

Use your own domain for your Netlify site for free

Custom domains

By default, your site is always accessible via a Netlify subdomain based on the site name. Custom domains allow you to access your site via one or more non-Netlify domain names.

• pensive-jones-60f272.netlify.app

Default subdomain

DNS configuration

Recommended:
Point ALIAS, ANAME, or flattened CNAME record to apex-loadbalancer.netlify.com

If your [DNS provider supports ALIAS, ANAME, or flattened CNAME records](#), use this recommended configuration, which is more resilient than the fallback option.

Create an ALIAS, ANAME, or flattened CNAME record for changeo.click pointing to our load balancer at apex-loadbalancer.netlify.com.

changeo.click ALIAS apex-loadbalancer.netlify.com

Fallback:
Point A record to 75.2.60.5

If your DNS provider does not support ALIAS, ANAME, or flattened CNAME records, use this fallback option.

Create an A record for changeo.click pointing to our load balancer's IP address 75.2.60.5.

changeo.click A 75.2.60.5

- SSL > Verify DNS configuration

HTTPS

Enable automatic TLS certificates with Let's Encrypt, or use your own certificate

SSL/TLS certificate

We could not provision a Let's Encrypt certificate for your custom domain.

To provision a certificate automatically, Netlify needs to go through a domain validation process on your behalf. This step cannot be completed unless the DNS records for your custom domain are already pointing at our servers.
